Learn and play

funtronic **floor**

**is an interactive education tool with
built-in computer, projector and motion detector.**

The image displayed on the floor creates a virtual "magic carpet", where pre-school and school children go through a great adventure. Learning and playing with this interactive floor develops gross motor skills.

Functionality of the **funtronic Floor** enables a wide range of applications in any room, on a light and smooth surface. The size of the displayed image depends on the height of the suspension of the device over the floor and is typically similar to a rectangle with the dimensions of a 6'-9 feet. The advantage of this unique on the market education tool is extraordinary ease of use with just a remote control - similar to handling the household TV.

Funtronic Floor was designed by Polish engineers and is produced in Poland
